

ROLE CARD · PRODUCTION PLANNER · SUPERVISOR+

Production Planner

Pages: Work Orders · Scheduling · Dashboard · Action Inbox. You are the office–floor handoff: nothing reaches an operator's queue until you release it.

CREATE AND RELEASE

1	Create the WO at Work Orders > New. Auto-routing copies the part's released routing; “No released routing found” means get it released or add operations manually.
2	Serialized job? Enter serial numbers one per line — the count must equal quantity ordered.
3	RELEASE the work order. Only released WOs appear in floor queues. Release is draft-only and needs at least one operation.
4	Print the traveler (QR-coded). Traveler QRs are lookup-only today — operators still clock in from the kiosk queue, not by scanning.
5	Watch the Dashboard and Action Inbox for holds and blockers; resume held operations from the desktop.

WHEN THE SERVER SAYS NO

- 409 “process sheet unavailable”: the routing points at a sheet with no released revision. The fix is release the sheet or detach it — retrying will not help.
- Refusal messages (“Only draft work orders can be released”...) are the system enforcing a rule. The text is the real reason — read it.

WATCH OUT

- TRAP** — KNOWN BUG: Create can silently do nothing when auto-populated run times are not in clean 0.1 steps (e.g. 9.99). If Create “doesn't work,” re-enter run times as 0.1-aligned values.
- TRAP** — Release has no undo — a wrongly released WO is visible to the floor immediately.
